Introduction

Description

The Random Quote Generator is a simple Python program that provides users with inspirational quotes based on their chosen category. The program allows users to enter their name and select from three categories: Motivation, Study, and Self-Love. It uses Python's random module to display a randomly selected quote from the chosen category.

This project aims to provide users with simple reminders that may encourage them in their daily lives, especially in studying, personal growth, and staying motivated. The program is designed to be easy to use and understand, making it suitable for beginners learning Python programming.

Objectives of the Study

General Objective

To develop a Random Quote Generator using Python that provides users with random inspirational quotes based on their selected category.

Specific Objectives

Specifically, this study aimed to develop the following:

1. Develop a program that allows users to choose from Motivation, Study, and Self-Love quote categories.
2. Generate and display a random quote based on the user's selected category.
3. Provide an option for users to generate another quote or exit the program.

Scope and Limitations

The Random Quote Generator is a Python program that allows users to enter their name, choose from three categories (Motivation, Study, and Self-Love), and receive a randomly selected quote. It also allows users to generate another quote or exit the program. However, the program only contains pre-written quotes, does not allow users to add their own quotes, and runs only in a text-based Python environment.

Definition the Term

Python – A programming language used to develop the Random Quote Generator.

Random Quote Generator – A program that selects and displays a quote randomly from a list.

Category – A group of quotes organized by topic, such as Motivation, Study, or Self-Love.

List – A Python data structure used to store multiple quotes.

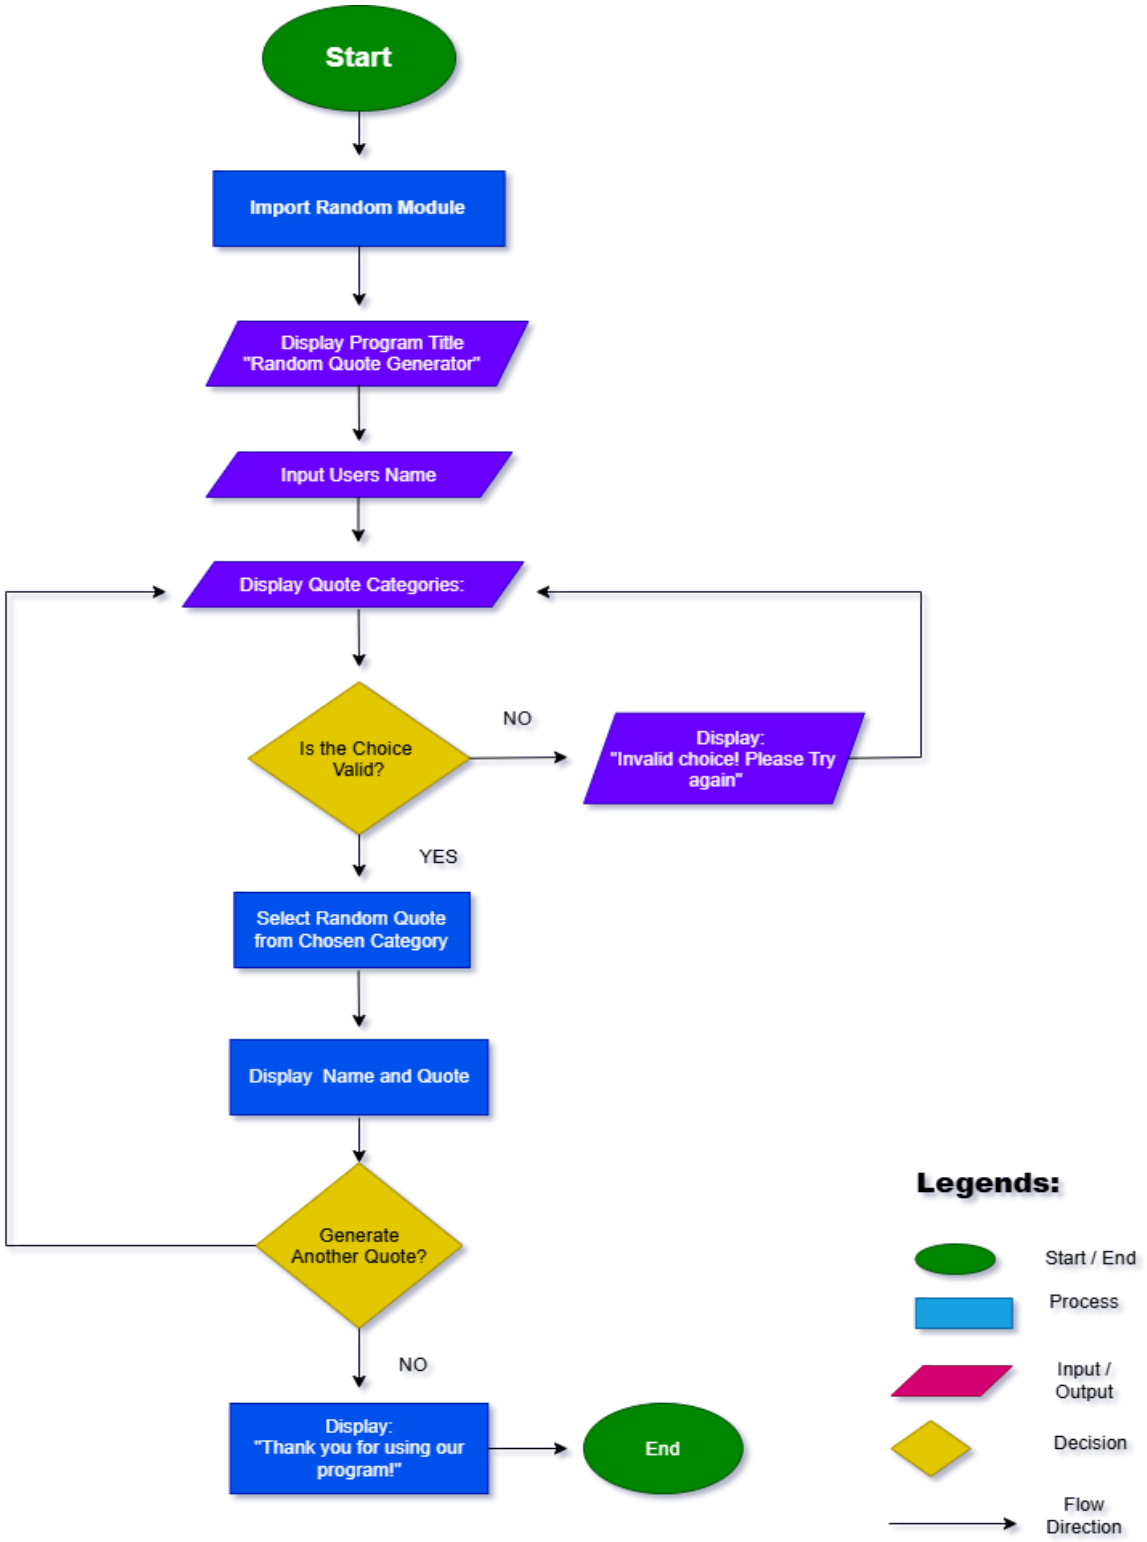

Random Module – A Python module used to select a random quote from the list.

Loop – A programming structure that repeats a set of instructions.

Input – Information entered by the user, such as their name or category choice.

Break – A Python statement used to stop a loop.

Flow of the Data

Key Features

Personalized Greeting – Allows users to enter their name.

Quote Categories – Offers Motivation, Study, and Self-Love categories.

Random Quote Selection – Selects a quote randomly from the chosen category.

Repeat Option – Allows users to generate another quote without restarting the program.

Input Validation – Checks whether the selected category is valid.

Simple Interface – Uses text and menus that are easy to understand and operate.
